

Standard Operating Procedure (SOP) for Updating Customer Master Records in the Database

1.Objective:

The objective of the Standard Operation Procedure(SOP) is to explain the process of updating the customer's master data records in the database ensuring accuracy and security in handling the customer data.

2.Process Map:

3.Description:

3.1. Request Initiation:

- a. The requester identifies the need to update the customer's master records in the database.
- b. The requester sends the request to update customer master records along with the supporting documents.

3.2. Review and Validation:

- a. After receiving the request, the Data Steward reviews the request and supporting documents.
- b. The Data Steward conducts manual checks to identify duplicate data.
- c. If the duplicate data is found, then the data steward contacts the customer and gets the required details
- d. The Data Steward then validates the data using reference websites. If this validation check fails, the Data Steward routes the request back to the Requestor with the required comments.

3.3. Processing in Oracle:

- a. If validation is successful, the data steward proceeds to process the request in Oracle.
- b. The data steward ports the data to the oracle and checks for sensitivity.
- c. If the data is not sensitive, the process ends here
- d. If data is sensitive, the supporting documents are attached to the customer's records.
- e. Updated records are executed in the Oracle.

3.4. Confirmation

- a. Upon completion, the data steward sends the confirmation email to the requester along with the screenshot of the updated customer master records.
